CLEAN DESIGN BLAST GATE

Ibis has introduced an improved "Clean Design Blast Gate". In many typical filtration applications, a standard Blast Gate operates at 90 degrees to the air stream. A clean Design Blast Gate operates at 45 degrees to the air stream. This design allows the air to move smoothly through the Blast Gate, reducing buildup and blockages. This is a simple upgrade that Ibis can provide. If you are having jamming or blockages in your pneumatic conveying system, contact Ibis for additional information and assistance.

Ibis International offers a wide variety of services from complete system Engineering, onsite support and a large selection of process air handling equipment. We also offer a full line of replacement parts for ***Ibis*** and ***Osprey*** equipment.

IBIS also Offers:

- ***Bale Openers & Volumetric Feeder***
- ***Scrap / Trim Collectors***
- ***Electrical Controls***
- ***Acoustical / Sound Enclosure***
- ***Reclaim Systems***
- ***Central Vacuum Cleaning Systems***
- ***Parts & Media for all drum filters***
- ***Field Service and Installation***
